Hyperception FIRST IN SAGE AND STRIDE GRAPHICS

SAGEBRUSH: GRAPHICS HARDWARE FIREPOWER FOR SAGE AND STRIDE SYSTEMS . . .

- True 3D-mapped graphics and text. Images may be transferred to and from disk, and to a dot-matrix printer. Text may be of any size and boldness and written at any angle.
- 512 x 432 resolution (interlaced display) or 512 x 384 resolution (non-interlaced display). Units may be upgraded to 512 x 512 resolution by adding memory and changing an EPROM.
- Multi-user/single display and multi-user/multi-display operation. In the former case all users share a SAGEBRUSH unit and display; in the latter, each user has a display. Dedicated multi-user operation is achieved by sharing SAGEBRUSH units together.
- BRUSHBAT mouse or graphics tablet pad option. Connects directly to SAGEBRUSH unit (doesn't use computer serial port), supports dedicated multi-user operation.
- Standard monochrome-compatible video output. Requires only standard, inexpensive (less than \$100) monitor. Accepts queries of terminal and graphic displays. Video output available at both phone and BNC connectors; two displays may be connected in parallel.
- Printers with detachable media supported. Okidata, Epson, etc. HP Laserjet, too.
- Fast SAGEBRUSH/MSX video memory interface doesn't hinder computer operation. Memory-to-memory display update rate of 25.4 frames/sec. (10MHz/6000 frame x 4.3) x 512 resolution (2kbyte video memory). No computer serial port required.
- Sage to Stride upgrade at any time. Upgrade package includes "connector/transition" card (no active components and 0 ECU).
- Small (8.5" x 4.5", 2"), attractive "baby Sage" unit that connects easily to Sage and Stride x86 series machines.

. . . AND SOFTWARE THAT WON'T BATTLE YOU OR YOUR COMPUTER AND EVEN MAKES FRIENDS WITH THE STRIDE TERMINAL GRAPHICS OPTION!

- Powerful command set software. Includes real-number display scaling, windowing, character size, boldness, rotation, and stem direction, foreground line-draw, arc, ellipse, and quadrilateral generation, image transfer to and from disk and to printer, and Bootstrap image operations.
 - p-System (Pascal, BASIC, FORTRAN 77)
 - 68000 asm. language and PASCAL source code support for other operating systems.
- p-System Hypermedia applications packages offer menu-driven interfaces to provide immediate, useful graphic output.
 - Hyperpic Business Graphics creates 3 types of output displays from text files. Single text file format for all displays.
 - Hyperpoint Statistical Graphics generates figures and free-form graphics via icon selection. Requires BRUSHBAT mouse.
 - Hyperignal Signal Processing Graphics provides time and frequency analysis, fast 68000 asm. lang. signal processing library.
- SOFTWARE RUNS ON STRIDE TERMINAL GRAPHICS OPTION, TOO. There is only one version of SAGEBRUSH command set software: a "hardware recognition" routine automatically determines host machine type (Sage or Stride w/SAGEBRUSH, or Stride with Sage graphics wanted).

*****ALL PRICES SUGGESTED RETAIL ONLY; DEALER PRICES MAY VARY*****

Learning UNIX — Sink Or Swim

By Verlene Joyce Barham

When you go swimming, do you the traditional type that wades mostly down the beach and plunges into the water on first sight? Regardless of water temperature?

I once ended up a summer camp with a gal from Michigan who was never bothered by the coldest water. My friend claimed that a group of her high school buddies went to head for Lake Michigan on "good" days in the early spring, out before the ice and jugs of February.

Anyways, I'm the cautious type. When I go swimming, I usually don't go in first to test the temperature and then start to look for rocks, sharks, jellyfish and other hazards before wading in.

I apply the same technique to new software. For some years, I've been submerged in the p-System and Pascal environment with a little CP/M on the side. At

one time or another, I've also poked and prodded at about every new OS that runs on a Stride or Sage.

Several months back when UNIX started to run basic on the P&S line, I naturally wanted to "get my feet wet." My office system at that time was a Sage, however, which wouldn't run UNIX, (no memory management unit). But, with a little help, I ran a cable from a serial port of my Sage over to an P&S-UNIX system terminal port. After writing a quick-and-dirty Pascal program to pass bits back and forth and emulate a terminal, I could now talk to the UNIX system from my p-System. Anytime I had a chance, I'd log on and try a few commands.

This was slow and gradual and very painful. If something troublesome, I could always ask one of our UNIX experts or call up the on-line manual.

Other Stride employees were trying the UNIX water, too. Tech Support, (Mike and Chris) and I all encouraged them to use **learn**, a tutorial program, since it's much nicer than reading through the three huge Motulus UNIX reference manuals. The reactions from these new users weren't so positive.

Our PR manager, a journalism major, took instant admission to the wading and phrasing used. Sentences such as "When UNIX types a "N" at the" gave her cold chills. The little pieces where an extra message is fed popped up into annoyed fur. Once she pointed those out, the rest of us started seeing problems, too. Heck, maybe you could try to time to realize all that for just \$88. **learn** has a lot to offer the new UNIX user.

After I had some idea (I thought) of how

to learn, I got my own UNIX Stride 440 system. While the system is started by a few marketing files, who aren't heavy users, I'm the main user and, supposedly, the system administrator. About 80% of the installation went great. Several major important features, however, required assistance. For instance, don't you think it is important to have your system tell you a funny message when you sign off? Of course that thing should occur on every 20th line. And, forsooth of honors, the print spooler didn't understand line printers that use single sheet paper instead of fan-fold.

Obviously, turning up a UNIX system is much more work than just being a user. I've got a lot yet to learn.

UNIX is process oriented and runs several little background processes, called daemons, (yes, spelling is the archaic Dickens style) such as **crond**, which keeps the system time. The UNIX daemons are continually up to something. My 440 has a hard disk with a video coil actuated drive, it has floppy drives and changes continually all by itself. This is a little scary at first, but soon the sound becomes just background noise.

UNIX has a great electronic mail system. Mail is passed from a UNIX computer to UNIX computer via a protocol called **uucp**. Costs are reasonable since it involves only short haul telephone calls between each site. Sometimes the path to reach another site gets quite involved with that going through 10 or more machines all across the country.

I like the mail and consider it one of the best features of UNIX. Being able to send a message to another person, simply by typing **mail othername** from your terminal is a feature that I'd say it's not very secure. Don't send too secret business deals over UNIX mail. Sometimes your message disappears down a hole.

Exploring UNIX is like one big "adventure" game. After you learn most of the major words and operations you become part of the UNIX club. Once introduced to UNIX systems, bring up another operating system for people. At least three people came by to ask if my system had crashed (my mail was being returned) and if they could help load it back up. Happenings to a UNIX user is the nice warm feeling you get knowing that you belong to one of the most active computer cultures in America.

There's always more to learn about UNIX. And just as you figure something out, a new version comes along with different bells. But as one advanced customer to you (readership on the shore), I can only say (as my boss has said), "Come on in. The waters fine!"

□

Editor: Verlene Barham

ix Stride is a monthly publication of Stride Micro. Subscriptions are \$14 per year. \$16 internationally. Purchase of a Stride computer includes a one-year subscription upon receipt by Stride. More of a fully completed order is required. Send Stride your complete \$14 per copy, all country bills. Requests for subscriptions, reprint permission, ad rates, back orders or subscription of prospective articles should be sent to the Editor, ix Stride.

Stride Signs United Kingdom Agreement

By Rick Kries

Stride Microsystems, formerly Sage Computer, has entered into a \$5 million manufacturing/distribution agreement with Equinox Computer Systems Ltd., one of the United Kingdom's leading computer manufacturing firms.

Equinox was formed in 1975 to specialize in multiuser microcomputers. In 1981, it became one of the few companies on the approved list for supply of microcomputers to the UK government, supplying the requirements of Defense, Health and the British Revenue. Equinox is also a major supplier of systems to hospitals in the UK. The company has a staff of more than 75 with its own engineering division for hardware maintenance.

Michael Kuzinski, managing director and founder of Equinox, will have his firm manufacture the Stride 480 Series. The UK distribution arm will be called Stride Micro UK and will be responsible for distribution, marketing and support of the 80000-based family of superminis.

Kuzinski states, "I feel there is a great opportunity for Stride in the UK. Equinox has a proven manufacturing presence there with a strong foothold in government and major account sales which will benefit both companies.

There is currently a nucleus of Value Added Resellers and we see a rapid expansion of these to handle the increased market interest in UNIX V, a system and particularly British products BOS, MPWGL and DICKER."

Kuzinski and Stride, Stride's vice president of International Operations, have designed their UK strategy to continue to strengthen Stride's position as a leader in development systems while making strong inroads into the business world with UNIX. Stride's UNIX system is attractive to many new businesses because it offers high performance at a good price. (See the article on UNIX in this issue.)

More than 3,000 Sage/Stride systems are already installed in the United Kingdom, in such places as British Leyland, Westland Helicopter and the University of Oxford.

Equinox will be involved primarily in the manufacture of the Stride 480, the heart of the 400 Series. The 440 is similar in size to an IBM PC but will be 8008000

The Equinox facility is in the heart of London near scenic sites such as the Piccadilly Gardens.

processor, it performs more like a large mainframe. The 440, which comes standard with 101 Kbytes of RAM, a 540K floppy disk drive and ports for four users, can be expanded to accommodate up to 16 users with 8M bytes of RAM and Winchester options ranging from 10 to 8.7M bytes. The Stride features Multibus architecture making it compatible with hundreds of vendors' products. Several networking options are available.

Stride Micro UK is expected to begin manufacture of Stride products during the first quarter of 1988, under the terms of a separate agreement. Equinox also will be integrating Stride-designed boards into their own high-end business systems.

Distribution activities will be headquartered in Equinox's 25,000-square-foot London facility. Distribution will be controlled by Master Dealers, each of whom will have expertise in particular operating systems environments. Stride feels that the Master Dealer concept will provide

the highest level of satisfaction to customers and repeat business to the dealer.

Stride supports more than a dozen operating systems, including DOS, UNIX, g-System, CP/M 800, PM/DOC and Mosaic." Kries said. "We see a company that believes strongly in customer support and feel we can offer UK users the best support by allowing dealers to maintain the systems they know best."

Kries and Kuzinski will officially announce the new distribution and launch the Stride 480 Series into the UK in London during the week of November 4. This introduction will provide an opportunity for all dealers, prospective dealers, VMS and OEMs to learn more about the Stride 480 Series and the role of Equinox and Stride in conjunction with the introduction. Stride will hold hardware and software training courses. Representatives from Stride's corporate headquarters in Reno, Nevada, will be on hand to discuss marketing and product plans. □

400 Series

New Faster Specs For Stride 400 Series

The 400 Series is getting better all the time. At the Computer Dealer's Exposition in Las Vegas (COMDEX), Stride announced new standards for all models which boost both performance and memory at no additional cost. Effective November 20, 1988, all Stride microcomputers include a 12 MHz 68000 processor and a full megabyte of RAM.

The new processor replaces the standard 18 MHz CPU offered in the past and should yield performance gains up to 30 percent. To complement this performance increase, 160 types of Disk will also be standard on all machines to allow users to take maximum advantage of Stride's **RAM Disk** and new **CACHE Disk** options. All RAM will be implemented using 256K-bit, 120 nanosecond DRAM chips to meet 12 MHz 68000 specifications.

Stride's Vice President of Marketing, Buddy Frank, said the changes were in keeping with the company's position of offering superior price/performance ratios. "We've provided these features as extra-cost options since the 400 Series was introduced in September of 1984, but with

related component price reductions, we are delighted to pass the savings, and the price, along to our customers.

"The change comes at an excellent time," Frank added. "RAM, which is becoming more and more popular on Strides, requires a megabyte to be effective, and the **CACHE Disk** just implemented will allow those using other operating environments to really benefit from the increase."

The disk caching software is part of the Stride 4000 and was released along with the 421 μ-System in September. Stride's **CACHE Disk** permits performance gains similar to **RAM Disk** but affords a greater degree of data security by passing "writes" through to the storage device. Unlike other popular disk cache systems

with severe memory limits, Stride's implementation permits the user to create large and effective RAM caches.

In addition to the changes in the minimum systems, an expansion RAM, from one to 12M bytes, has been lowered in price to about \$4,200 per megabyte. For those current owners wishing to take advantage of the **CACHE Disk** and the other features of IV21 μ-System, a software update is offered. See Page 14 of this issue for details.

The changes announced this month, together with additions made in September, give the Stride 400 Series the power and flexibility to meet virtually any computing needs now or in the future. The table gives a complete rundown of current specifications. □

FEATURE:	405/440	440	450
PROCESSOR 68000 16.25-MHz machine	1 MHz	1 MHz	12 MHz
PARITY MEMORY 16-bit Data Check	1 or 24 bytes	12.4 or 80 bytes	12.4 or 12M bytes
DISK RAM (always locked on)	on	on	on

SWITCHING POWER SUPPLY	no	no	1.670 (or less 1.620 V)

*Blue shows standard features.

New Demo Ready!

It's too bad our printers couldn't figure out a way to make the figures to the left rotate on the page as they do on the Super 400 Series graphics screen.

The figures were created by Don Marsh, a doctoral candidate at the University of California, Berkeley, using a Super 440 running System 7.0/80. The objects were created from a mathematical description and then processed by the graphics programs *Shogun* and *Limbo* into individual frames. Each frame shows the object rotated a few degrees. The graphics system rapidly displays the frames, giving the illusion of continuous motion.

Marsh's Bill Graham then figured out how to condense the frames to fit onto two floppy disks. A third cassette contains the operating system and the *DISPLAY3D* program. *DISPLAY3D* was written by utilizing the standard *Slide* graphics software to download and display the graphics as fast as possible. Real-time speeds worthy of the name *multimedia* were achieved. Of course, downloading is even faster from a Winchester hard disk.

Once you start the display, you'll be reluctant to turn it off. You can control the speed of rotation for slightly different effects. Typing the "-" key the rotation slows down, typing the "+" key speeds the display back up. The wire frame of the ship mine (left) appears (figure) may appear to switch directions. This is really just an optical illusion. Your brain and eye have been fooled by the symmetry of the figure. The display is always going the same way.

If you run the display very fast, some frames will be skipped. At a certain point, the rotation will suddenly appear to reverse. This illusion is the same type as the classic case of the stage coach wheels appearing to turn backwards when the coach moved fast.

The figures look very "3-D" as they turn, the lighting is accounted for, note the shape patterns on the bottom bar. The light is obviously overhead. The small bar inside the larger one also rotates -- in the opposite direction!

This is a fun program (like most graphics) and a good example of the great things you can do with a *Slide*. It makes a good demo at trade shows or for your friends. If you're got a *Slide* graphics board and at least 2M bytes of RAM you can run it. The part number is 870-104 for only \$89! Enjoy! □

This type of drawing is a "wire frame" of a ship mine.

Because the bands are asymmetrical, their movement will seem jerky compared to the other displays.

This simple gear turns gracefully and elegantly in space.

These two hollow balls rotate in opposite directions. Note the elliptic patterns which indicate an overhead light source.

COLOR GRAPHICS FOR STRIDE/SAGE

We offer medium and high resolution color graphics boards for Stride 833 series and Sage Computers.

EUROGRAPH 1

- Resizable resolution to 1024x1024 pixel
- 256K 16-colors
- Pen, Spray, Zoom, Drawin functions
- High drawing speed
- Video card is part of 80000 address space and can be used as RAM or for background graphics

EUROGRAPH 2

- 32000 pixel
- 8 colors or gray shades
- Graphics processor (1 million colored drawing speed)
- 3 independent video memory banks (1600K 32K)
- Light pen and keyboard interface

More about Image Processing boards and other VMS-bus products

Graphic resolvers supported for CMA, DPM, MIMAGE, UNIX 3-bus.

UNIX's Time Has Come?

By Buddy Frank

They saved the best for last. That's certainly a fitting phrase to apply the 48600-based Stride has just recently emerged as a leading hardware choice for UNIX users. While we like to think that's the only reason, a few other factors were at work.

UNIX was pioneered by Ken Thompson and Dennis Ritchie at Bell Laboratories over back in the late 1960s to aid in program development. It seems that every month since then, one report after another has predicted UNIX would soon become THE operating standard for microcomputers. Today it still hasn't happened, but

there are some compelling reasons why it hasn't.

First, UNIX hardware history was written on microcomputers, not PCs. The test port was on a modest DEC PDP-11. Its good design was almost perfect. Ritchie and Thompson transferred the OS to the machine. But UNIX quality grew and moved to the PDP-11 and VAX architectures where it developed an appetite for lots of storage capacity and a lot amount of memory. Most of the micro that followed the introduction of the Altair in 1974 were short of both.

Another thing the so-called PC revolu-

tion lacked was multiuser capability. Ironically, UNIX was originally developed as a single-user version of another multiuser OS, Multics. But it quickly evolved into an excellent shared-user system. In fact, it now seems to lay undisputed claim to the leading multi-user operating system on micro (with OS/2, MICO and Pico as some of the other competitors).

However, UNIX didn't even get its foot in the micro door until the introduction of the 48600 microprocessor. The chip, unlike the 68010, 80888 and Z-800 which controlled so many PCs, was finally able to support UNIX in the manner to which it had grown accustomed.

Still, there were problems. Memory was expensive in the late 1970s and early 80s. So were microchips that were big enough to really service the OS in full-blown development system can claim more than 20M bytes. Thus, UNIX microcomputers generally carried microcomputer price tags.

Today, things are changing. Hard disks are becoming commonplace and large memories are no longer multi-core megabyte is now standard on all Stride machines. The introduction of the Stride 400 Series with a memory management unit was one of the first UNIX systems that delivered that price-performance value from a microcomputer perspective.

Equally important, the 400 Series also provided UNIX developers with one of the few systems that could grow. Of the open-architecture level systems (the IBM PC AT and AT&T Unix PC), only the Stride is capable of supporting realistic multiuser operation. The 440 model easily expands from a \$3,300 floppy-based machine to a 16-user UNIX system, supported with 6M bytes of RAM, 87M bytes of storage and a fast backup unit.

Apart from hardware considerations, UNIX has some inherent qualities that have also slowed its adoption by the microcomputer community. With roots as a development system, UNIX now includes literally hundreds of utilities and routines. There's everything from a text processor to a complete mail system, not to mention a directory full of games and on-line documentation (unfortunately, with all the great comes complication and confusion).

UNIX commands can be cute, such as "whoami" to display the name of the current user. But they can also be a bit cryptic such as "ls" and "grep". For this reason,

The Stride Unix System is distributed on 1280-Block 5 1/4" floppy or quarter-inch cartridge tapes. The tapes hold up to 87M bytes of information. A tape system is recommended for UNIX operations, since it provides a quick and clean way to dump and restore large data files — or even the entire disk!

This diagram shows the many commands of a UNIX "shell".

many have compared using UNIX to playing "Adventure" if you know the right magic words, you can get through the maze. However, there's no getting around the fact that UNIX is large and can be difficult to learn. The adventer diagram gives you a glimpse of the many diverse commands available under UNIX. And users in business and industry were often unwilling or unable to make such an investment in time and training.

One of AT&T's early decisions to make UNIX available at a discount to colleges and universities is beginning to pay dividends. Dozens of students are now emerging with excellent backgrounds in UNIX use and development. Simultaneously, more and more applications that exploit UNIX's strengths, while tending to weaknesses, are beginning to fill the marketplace.

Programs such as R Office (see page 12) are bringing pleasant surprises to microcomputer users, while they carry slightly higher price tags than traditional

micro software packages, their power and utility more than make up for the extra dollars. As a rule, most UNIX applications are derived from "user" software concepts, providing powerful and proven solutions to a whole new audience. In contrast, micro software has often evolved from an IBM background, and much of it has failed to take advantage of the power provided by today's 16/32-bit processors.

The biggest impact of this new sophisticated software running under UNIX will most likely be in business and industry where the cost effectiveness of multitask systems provides affordable solutions to complex problems.

UNIX is large and bulky, difficult to learn, and poorly suited for smaller micros. On the other hand it is rich and powerful, and promoted by its hot horses. Whether or not it will be the operating system of the future, it is a question which will surely be debated for several years to come. But today, UNIX on the Strix has just to be in the right place at the right time. ☐

UNIX And The MMU

MMU stands for Memory Management Unit. On multiplex systems such as UNIX, an MMU greatly helps the complex task of keeping the many users and their operations separate from each other. One user cannot easily crash other users by making errors.

Almost all versions of UNIX require an MMU. Strix's 400 Series Minix is a daughter board design. It is a factory installed option and fairly simple to do. However, Strix does not authorize users or dealers to do the installation since it involves disassembling the machine to the CPU board level which should be done in a state-free environment.

Once the CPU board is tested, the M066880 processor is removed from its socket and the MMU is plugged in. Selected shunts are cut on the CPU board. The change is made to an operating system that does not require the MMU.

Without the MMU, the CPU board runs flat out when installed. The MMU operation only needs one extra wait state to accomplish its arbitration functions.

The 400 Series MMU allocates up to two segments of 4M bytes each. UNIX only uses two of the segments, one for the kernel in Supervisor Mode and the other to map the currently running user process. Each of the segments allows up to 1024 pages of 4K bytes each.

This means that the largest user program is 4M bytes. The program can be mapped anywhere within the 16M byte addressing range of the 68000. If the system has enough RAM, more than one 4M user area can reside in memory at the same time. ☐

UNIX POSTER

The shell diagram shown above is available for \$9.95 as a red and black poster, 21" x 28", suitable for framing. Contact Tom Wilson, TypoGraphics, 802 33rd Street, Apt. 4, Oakland, CA 94612.

THE MODULA-2 SYSTEM

MOSYS is the first system to provide an integrated software support environment for developing MODULA-2 programs.

MOSYS is a native code system: complete, self-contained, and well-documented to provide the ideal programming environment.

MOSYS includes compiler, assembler, editor, debugger, processor and symbolic debugger.

Madras City — Headquarters of Inteltech Limited.

EAST MEETS WEST

By Kate Hagan

Inteltech has now expanded its operations into the Far East. Inteltech, an electronics firm in India, and the Electronics Corporation of Tamil Nadu (ELCOIT), an agency of the India state government, have recently entered into a joint agreement with Stride Micro.

Under the terms of the agreement, Inteltech will have licensing and manufacturing rights to the 400 Series within the country of India.

Stride Micro currently distributes into over 40 countries worldwide, but has not previously encouraged its overseas distributors to open their own manufacturing sites. It is a major undertaking requiring extensive capital and most important, the active support of that country's government.

However, the Stride, Inteltech and ELCOIT agreement is strong in all areas. As Rick Bliss, Stride's vice president of International Operations, explains, "We

have granted this license based on the substantial commitment of resources from Inteltech and the Indian government."

At the inception of the project, the Indian government was searching for a company well versed in 16/32 bit technology that made use of VLSI circuit architecture.

In September 1984 Stride introduced the 400 Series MC68000 computer line. The 100100 is a design feature of that series. The 400 Series starts with a 10 MHz MC68000 and is now running at 12 MHz standard. Under the terms of the partnership, Inteltech will provide the feature, high-powered 16/32 bit technology to Inteltech.

ELCOIT will furnish Inteltech with a majority of the start-up capital. Financing for the project will come from both public and private sectors. Initial costs are projected at \$1.8 million, with production due to begin in January of 1985.

ELCOIT is the electronics division of the Tamil Nadu Industrial Development Corporation (TIDCO), a development agency run by the Tamil Nadu state government. ELCOIT makes direct investments into targeted industries. The investment being made is Inteltech is high, even by ELCOIT standards. The revenues to Inteltech are expected to be several million rupees within the first year. (The exchange rate for rupees runs about 10:5 to the U.S. dollar.)

In addition to the strong commitment of the Indian government, Stride's belief in the management of Inteltech is the prime reason for deciding to take this innovative marketing step.

Inteltech is located in Tamil Nadu's capital city of Madras and will build manufacturing facilities there. Madras is regarded as the Silicon Valley of India and is located only to Bombay in industrialization and technological modernization.

Several employees of Inteltech will need to be traveling to Paris, Nevada for training.

The first areas targeted by Inteltech are the banking and financial industries, insurance companies, hospitals, hotels, transportation companies, public utilities, educational institutions and libraries are all in the embryonic stages of computerization.

According to an extensive report drawn up by Inteltech, the Indian market for microcomputer technology is virtually untouched. For many years, restrictions on high technology imports and the fear by many Indians of man-power displacement retarded the growth of India's computer industry. Prime Minister Rajiv Gandhi has pressed for the opening of India to all forms of technological growth. Under his government, restrictions have been lifted or removed. Public sector employees have begun to realize that computerization will result in more, rather than less jobs, and the acceptance of computer technology has grown. About 500 people are expected to be employed in India as a result of this project.

Ancient India, land of wisdom, has ambitious plans to acquire Western technology.

STRIDE Faire '86

The fireworks will be inside this winter as Stride Faire '86 moves to the Nugget Hotel/Casino for a three-day run beginning February 28. The faire will feature new products, seminars, exhibits, and a special presentation by the development team responsible for the revolutionary new SkyDam. All attendees will also be eligible to win a complete floppy-based Stride 448 system. For more information, drop a line to Stride Faire '86, P.O. Box 30015, Reno, Nevada, 89520-0015 ☐

R Office

R Office is a powerful office automation package that combines a professional full-featured word processor with desktop utilities, a spreadsheet and a database. With both the receptionist and CEO in mind, R Office was designed to be the first and last product a consumer needs to purchase. It is a true multitasker application, written in high-performance 68000 Assembly code. R Office runs under UNIX or RM/COS on all Stride 408 Series systems. ☐

CP/M-68K

By Bill Rainey

CP/M-68K has been running on the Stride 440 Series since the machine was first introduced (officially in November, 1984).

The current version of CP/M-68K is version 1.2. For those of you who missed the update, an update from version 1.1 to 1.2 is available. An update for the Sage II and III is also available.

Before ordering, check that the version you have already is not 1.2. Stride has been shipping 1.2 for over a year. CP/M-68K includes a "C" compiler with a floating point package. The operating system supports TypeAhead, The DDT debugger has symbolic capabilities, Trap UNIX-like utilities, MCRB, file scroll text files and FREQ (to read files) have been added as custom utilities from Stride. There is an OVERLAY LINKER in addition to the standard linker. A conversion routine, TOCP/M, to transfer files from the p-System also is provided in the standard release.

The well-known SWS-Silicon Valley Software's compilers for FORTRAN 77 and Pascal run under CP/M-68K. Direct calls to the 400 Series BIOS are available. The Metacomex Lisp and symbolic manipulation program REDUCE run under CP/M-68K.

An emulator package is available from MICROVASE which will allow a user to run almost any IBM-PC/XT CP/M routine under CP/M-68K, including the popular WORDSTAR.

CP/M-68K is a very attractive environment for the user who needs all of the considerable power of the MC68000 for a speed-tough application or research project.

More than one user can share a machine, however. Multiple copies of CP/M-68K are supported under Stride's proprietary Multuser BIOS. Up to 14 CP/M-68K users can be supported, although it is unusual to have more than six. Shared access to a database is not recommended in this environment, unless the program has been written to use the 486-level semaphores. Multuser CP/M does work well for environments where each user has separate needs.

Version 1.2 is highly compatible with other Digital Research CP/M-68K versions on other microcomputers. The cost of CP/M-68K versus UNIX is certainly very attractive for a single user environment. And although traditionally a small machine operating system, CP/M-68K scales very well on Stride's 440 with large hard disks — up to 87M bytes. Many academic users have found that the 19M byte addressing capability of CP/M-68K and SWS Fortran 77 to be just what is needed for large number crunching problems.

Stride's CP/M-68K, version 1.2 is shipped on four diskettes with a Stride CP/M User's Guide and the Digital Research Institute's manual. It retails for \$250. □

Version IV.21 p-System Now Available

Version IV.21 of the p-System is now shipped standard with every Stride 400 Series. Stride continues to support our earlier computer line and a full release of IV.21 is also available for the Sage. An upgrade to just the BIOS and Utility files is also available.

The chart below gives part numbers and prices for the upgrades. Prices are in U.S. dollars; international users please check with your dealers for pricing.

Part #	Price	Product
SP100	\$ 99	400 Series Multi-TASK p-System: SYSTEM, UTILITY, and BIOS updates. Release notes.
SP150	\$150	400 Series Development: SYSTEM, UTILITY, BIOS and DEV updates. Includes Pascal Compiler and REDUCE executable. Release notes.
SP100I	\$ 99	Sage II/III Multi-TASK p-System: SYSTEM, UTILITY, and BIOS updates. Release notes.
SP100D	\$150	Sage II/III Development: SYSTEM, UTILITY, BIOS and DEV updates. Includes Pascal Compiler and REDUCE executable. Release notes.
SP2000	\$ 25	400 Series BIOS Update: One diskette with new BIOS, MULTUSER, UTILITY, and MULTISOURCE. These files are included in SP100 and SP150.

To upgrade to the p-System Pascal compiler, you have to provide proof of a prior purchase of the Program Development Kit. The Purchase Order number from your original order and Serial Number of your machine is best. □

How big is UNIX?

The main part of UNIX, the kernel, is actually quite small. It takes only 200K bytes of memory when running and only 178K bytes on the hard disk. Since actually uses a stripped down version of UNIX that fits on a single floppy to do the UNIX installation. Historically, however, because many utilities that have been added to UNIX are an integral part of the product, Sunde does not attempt to split all utilities into separate add-groups. The entire UNIX V, as shipped by Sunde, takes 15M bytes. The on-line manual needs another 8M. If you then allow for time your physical memory for a kernel space and a good sized user area, 15M rules most Unix installations need at least a 32M disk.

How do you photograph a computer screen?

Make sure the screen is not changing (a long exposure is necessary, so if possible, insert your camera on a tripod to keep from fudging the picture. For black and white shots, use Tri-X film 400 with 1/10-1/15, f 2 and 2 second exposures. For color, use 358 ASA, same exposures. Generally, the 1/15 and 1 second shots turn out best.

Can I put my 440 on a bookshelf?

MCi Mini bookshelves are not deep enough to allow clearance for air circulation around the machine. Cold air is sucked in from underneath the machine and through the side vents (also the foggy side) while hot air exits out the rear bottom. If any of these areas are blocked, you could overheat your machine. Also, don't sit the machine on top of paper or fabric surfaces as they tend to pull up and block the output of the fan. However, it is perfectly okay to pile cassette, paper books, etc. on top of the 440.

If I buy a 420 can I upgrade it to a 440 later?

No, we're sorry, but that is not an option. While the 420 and 440 share a CPU board, most other components are unique. The upgrade question is one reason Sunde has introduced the new floppy-based 440. This model will upgrade to a hard disk system easily and yet carries the same price tag as the 420. The only reason for buying a 420 instead of a 440 floppy based system is if the smaller size of the 420 is of great importance. □

Allison
Brown

Jon
Bengtson

Allison Brown has been a long-time employee of Sunde Micro, starting with us back in 1983. She has a degree in Housing and Design from Colorado State University, but when she graduated, Housing was in a slump while the computer industry was abating.

Her degree has been useful, though. Right now, she's working on the historical restoration of an old home in Washoe Valley.

Allison's favorite pastime is riding her registered Appaloosa horse, George. Allison rides English, a more practical style here in the West, and likes cross-country jumping. During the winter, George gets a real white the thing is good.

Allison has held varied jobs, editor Sunde and was recently promoted to Executive Sales Assistant. "I like my new job," Allison says. "Sales gives me a chance to talk to many different people, which I enjoy very much." Allison does final order processing for the USA and Canada — now that's a tall order.

Sunde's new Executive VP, is **Jon Bengtson**, Jon will oversee day-to-day operations as Chief Operating Officer. President Pat Coleman remains Chief Executive Officer, but is now free to pursue long-term planning.

Jon is truly a native Nevadan, coming to Reno in 1961 to attend the University of Nevada. He's remained here ever since, after graduating with an MBA.

Before joining Sunde, Bengtson served as an Financial Executive at Nevada, Sunde Report and International Game Technology. The latter gave Jon his first exposure to high-tech as the world's leading manufacturer of computerized gaming devices.

Jon is a dedicated outdoorsman, who appreciates Nevada's opportunities to go duck hunting along the mountains and fly fishing in the Sierra mountain streams. □

Uniplex II Integrated Software Combines Word Processing, Spreadsheet and Database for UNIX Users

Now you have the freedom to choose...

That's right, now that you can run UNIX on Stride Micro's file-server becomes - which software?

Uniplex II is your answer. It is a complete integrated software system for UNIX on the Stride. And freedom of choice is what it is about.

You can store your information and manage it under Uniplex II's powerful database. Then you can choose how to manipulate it. You can, for example, pull a file from the database, work on it in the spreadsheet and then manage it in Uniplex II's word processor for final formatting and printing.

Or you can take a word processed file and manipulate it under the database. Indeed with Uniplex II any file can be processed and freely interchanged with the components of the system - That's real freedom - to choose!

Uniplex II components include a word processor as sophisticated as any stand-

alone available. All the facilities are there including advanced features such as spelling checking and auto.

The spreadsheet component works with the best. With over 1000 columns and 1000 rows you're not likely to run out of space. All the commands and facilities you would expect in a high level product are there plus embedded database and UNIX calls. You even get an interactive tutorial system.

The Uniplex II database is a sophisticated relational DBM designed with all the leading edge techniques. Packed with power, the DBM allows files restricted only by UNIX limitations and features the comprehensive SQL query language. System builders will be delighted with its ability to meet their existing needs.

Other components in Uniplex II unlock your control over your computers. There is a Shell System for executing

UNIX commands, a Screen Buffer, a Print Spooler for controlling shared printers and a full featured communications facility.

Combining all these into one integrated product, written entirely in 'C', means real power for your installation. For your freedom of choice comes from Uniplex II's unique design.

Control command functionality over all components means one product to learn instead of many. Piping your information through any component gives you the freedom to decide how to manipulate it.

To choose Uniplex II the one integrated product solution to your office automation under UNIX.

Uniplex II is freedom of choice.
